```

Extra Credit

So, you processed about ~230 samples and did the normalization on a genome level. Now, you want to find whether there is any association of the 4 asthma-associated SNPs (rs8067378...) on ORMDL3 expression.

How many samples do we have?

```
expr <- read.table("rs8067378_ENSG00000172057.6.txt")
head(expr)
```

```
##    sample geno      exp
## 1 HG00367  A/G 28.96038
## 2 NA20768  A/G 20.24449
```

```
## 3 HG00361  A/A 31.32628
## 4 HG00135  A/A 34.11169
## 5 NA18870  G/G 18.25141
## 6 NA11993  A/A 32.89721
```

Q13: Read this file into R and determine the sample size for each genotype and their corresponding median expression levels for each of these genotypes

```
nrow(expr)
```

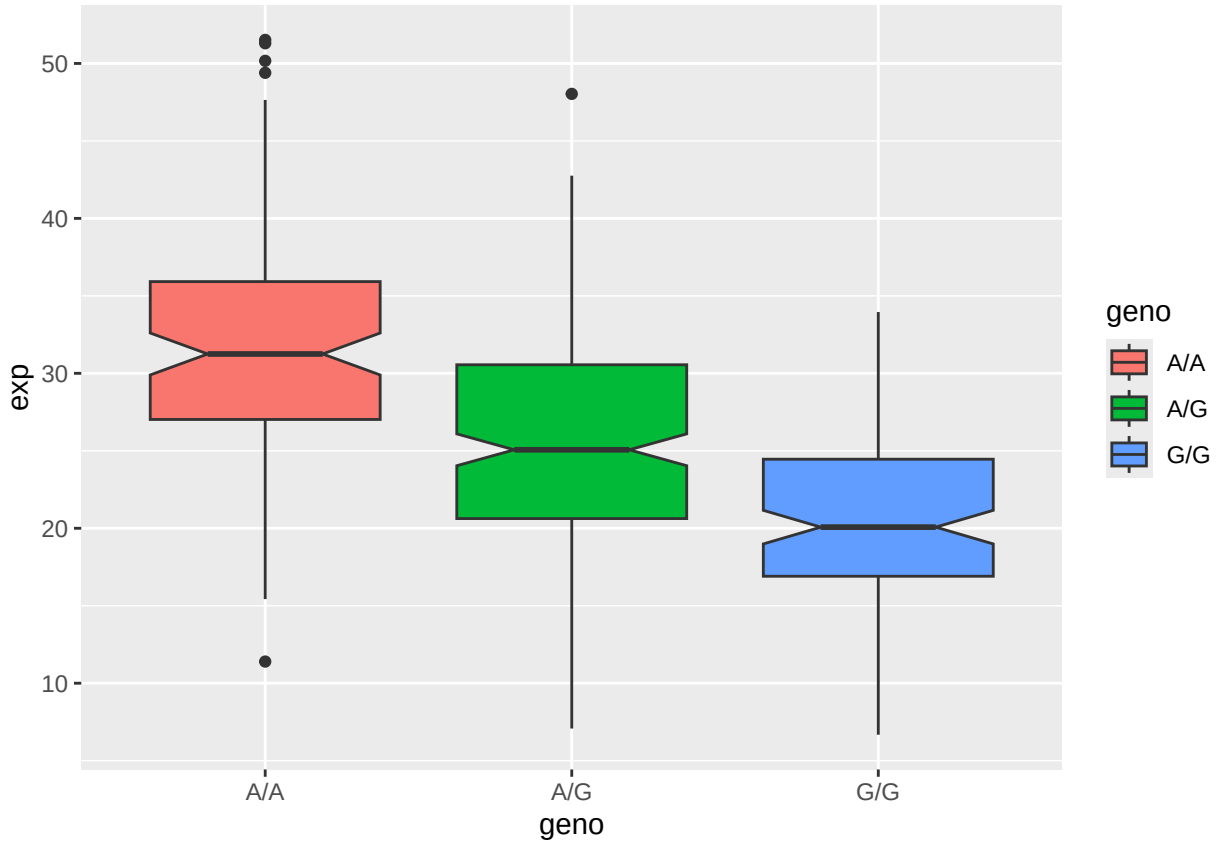
```
## [1] 462
```

```
table(expr$geno)
```

```
##
## A/A A/G G/G
## 108 233 121
```

```
library(ggplot2)
```

```
ggplot(expr) + aes(geno, exp, fill = geno) +
  geom_boxplot(notch = TRUE)
```



```r
ggplot_data<- ggplot_build(boxplot_data)$data[[1]]

median_values <- ggplot_data %>%
  group_by(x) %>%
  summarize(median = middle)

median_values
```

```
## # A tibble: 3 x 2
##   x          median
##   <mppd_dsc>  <dbl>
## 1 1            31.2
## 2 2            25.1
## 3 3            20.1
```
